Practical No.8

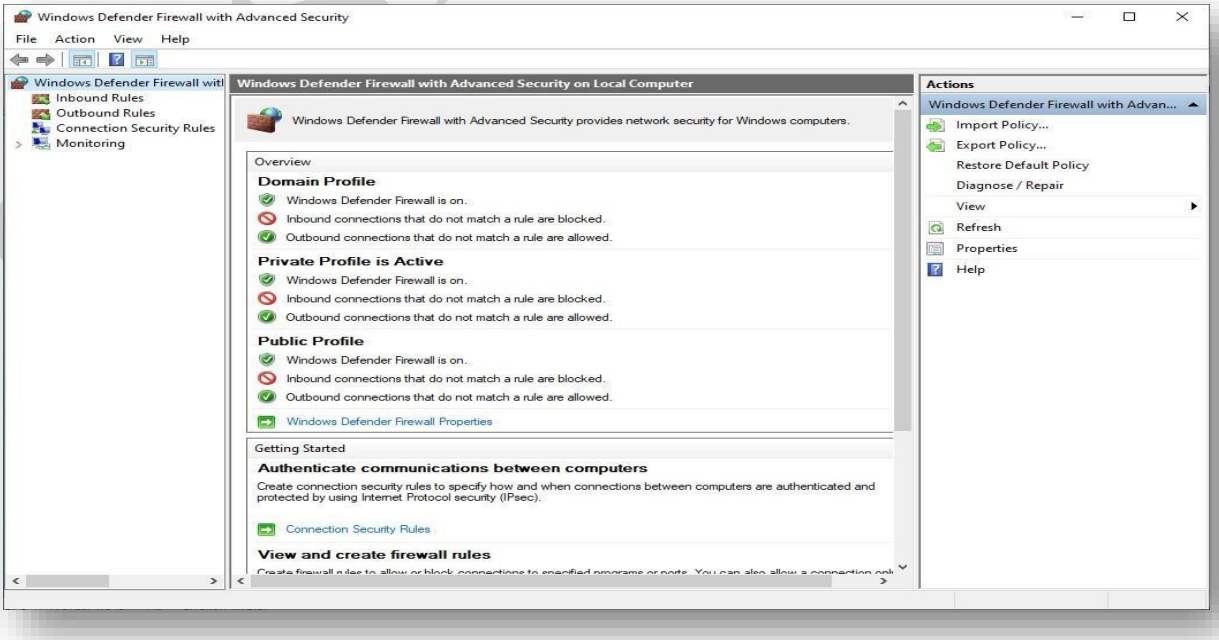

Aim: Firewall Configuration and Rule-based Filtering:
Configure and test firewall rules to control network traffic, filter packets based on specified criteria, and protect network resources from unauthorized access.

Step 1: We access any website through the browser and confirm that the HTTP/HTTPS protocols are working.

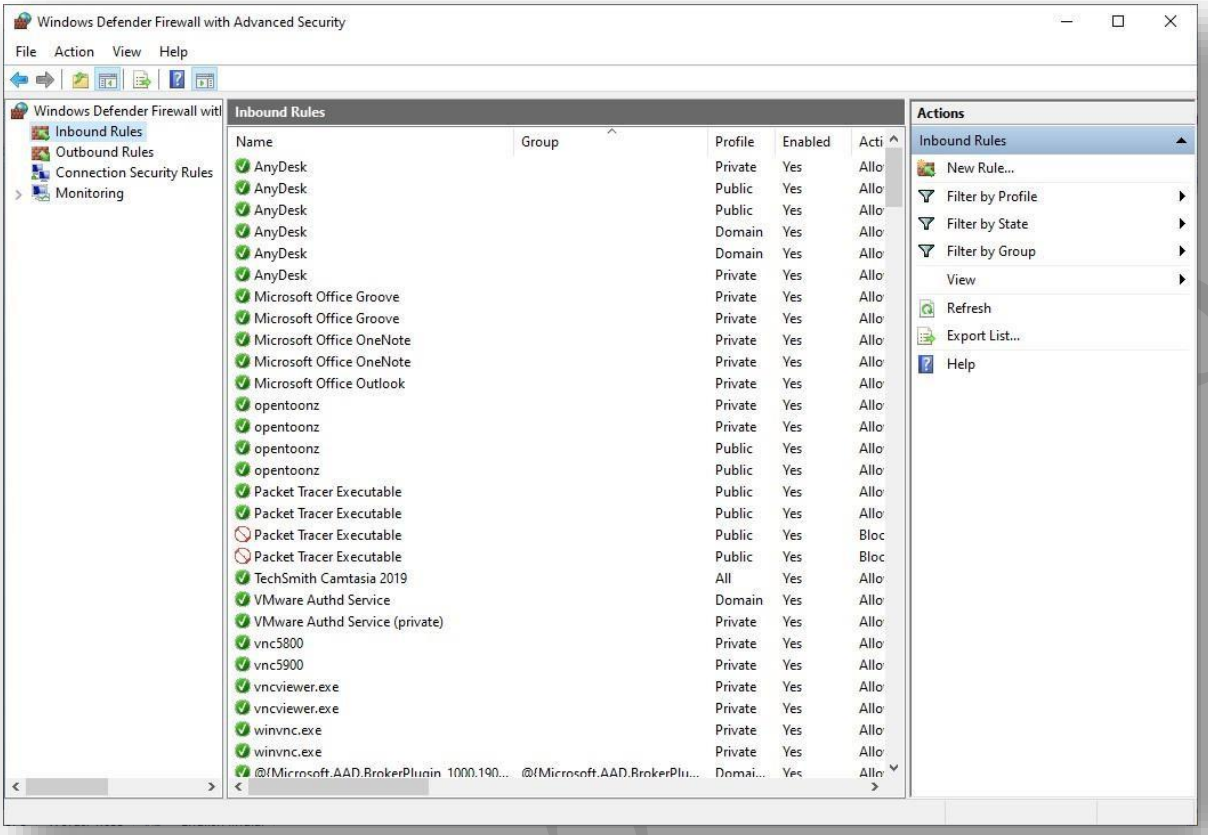

Step 2: We open 'Windows Defender Firewall'

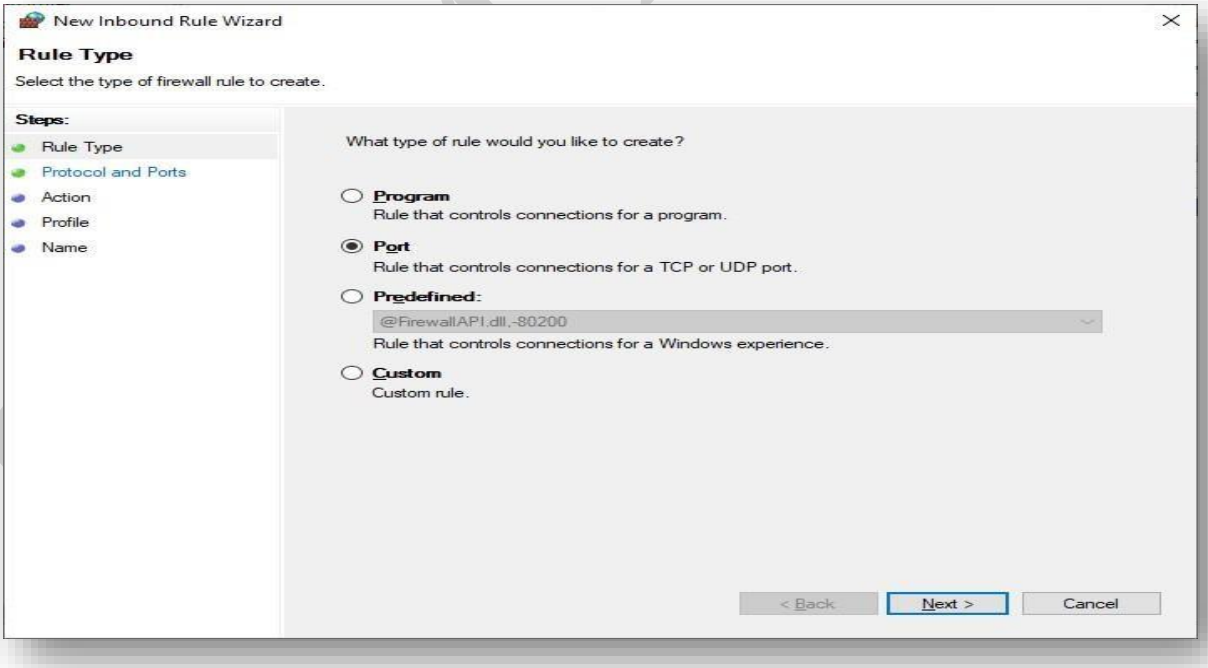

Next we click on 'Advanced settings'

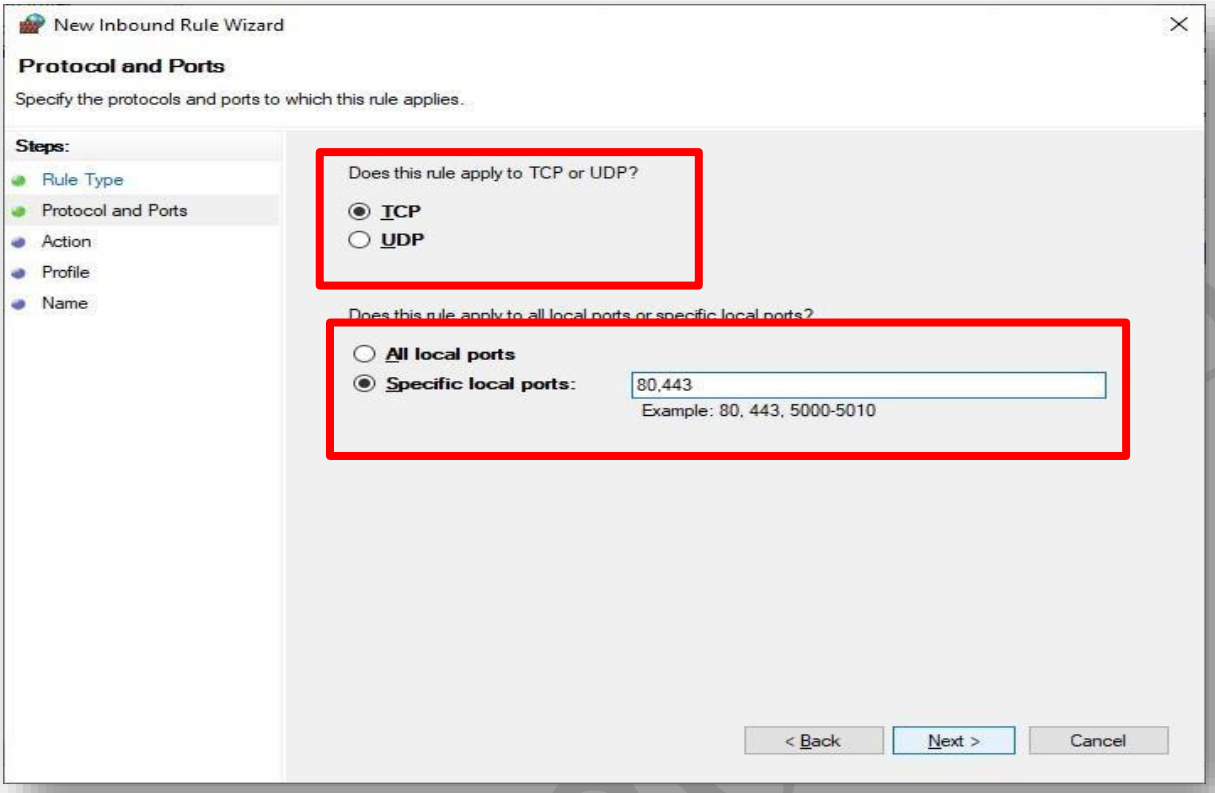

Next we click on ‘Inbound Rules’

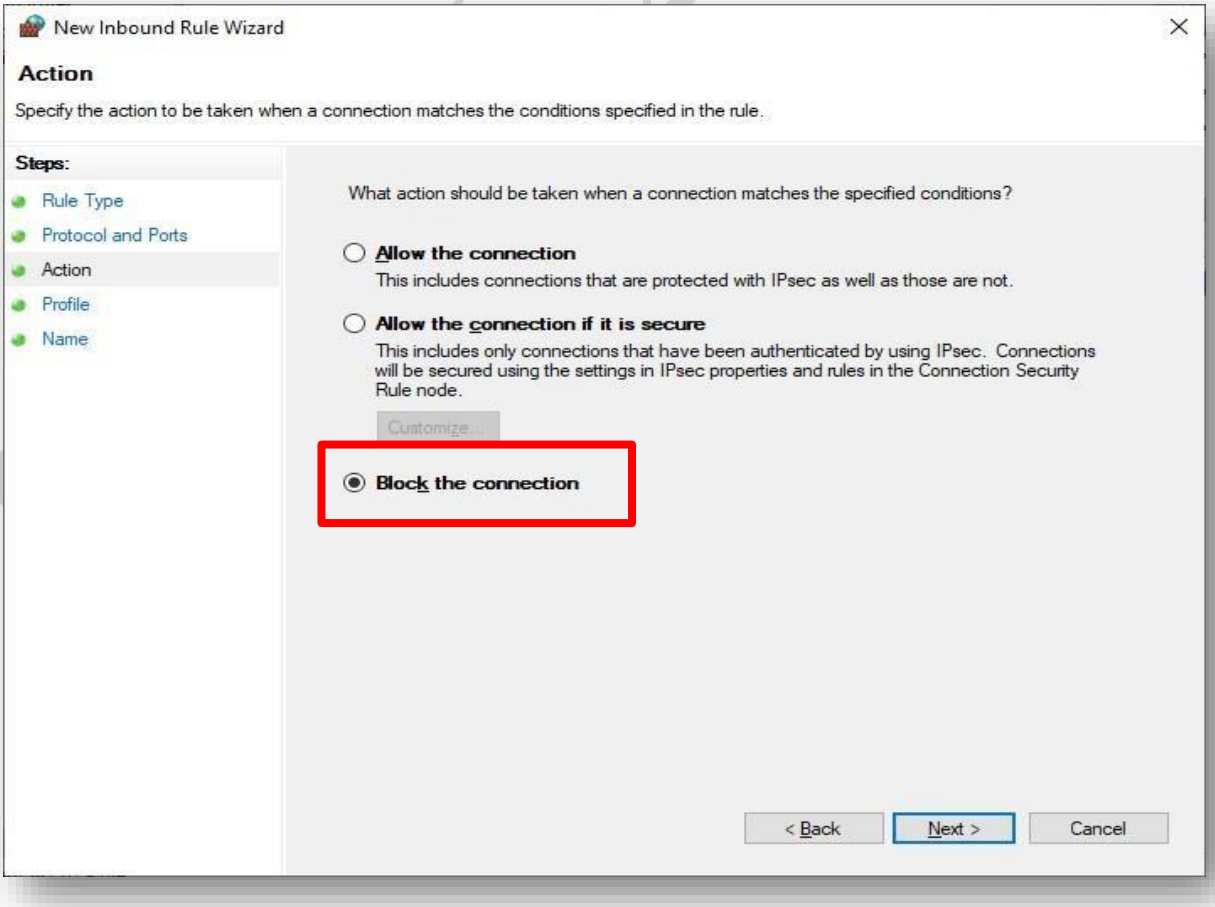

Then click on ‘New Rule’

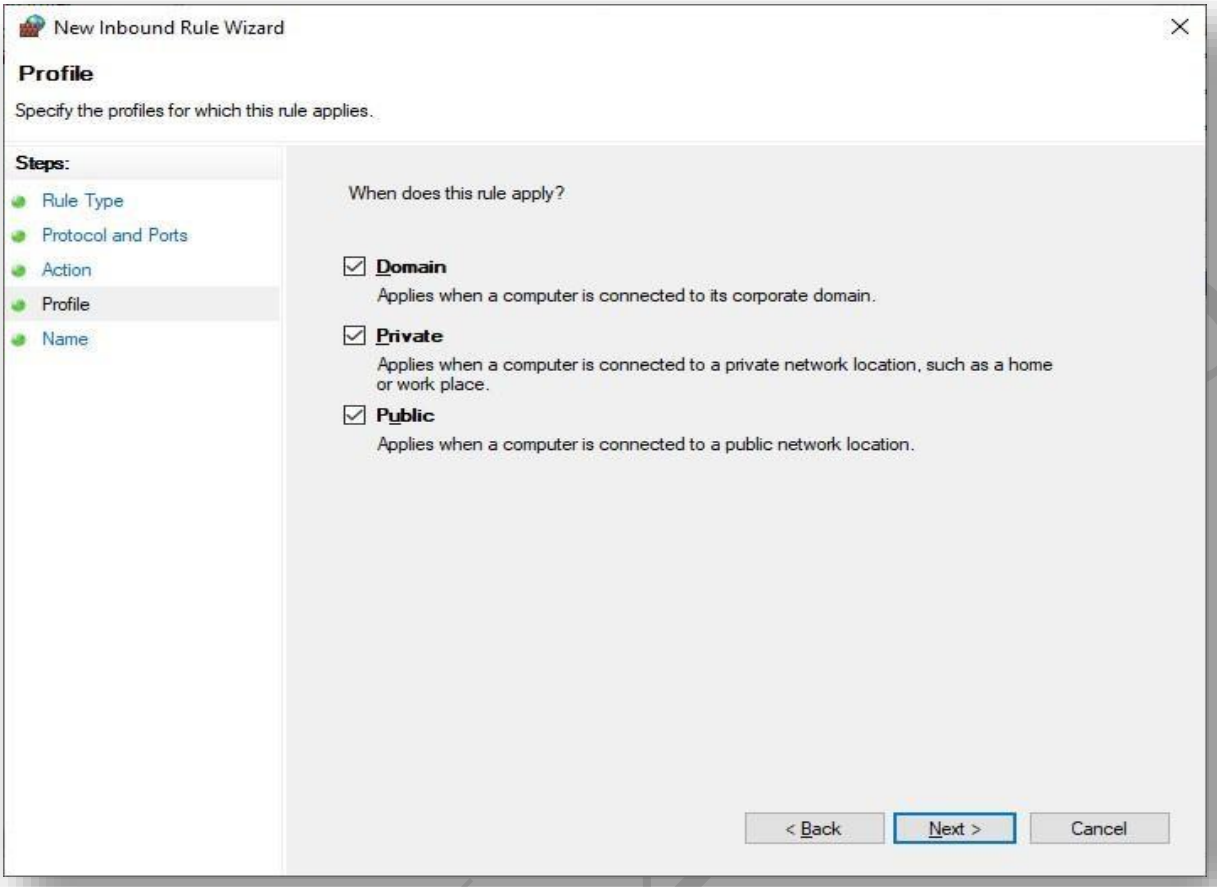

Select the radio button ‘Port’ and click ‘Next’ and enter the following

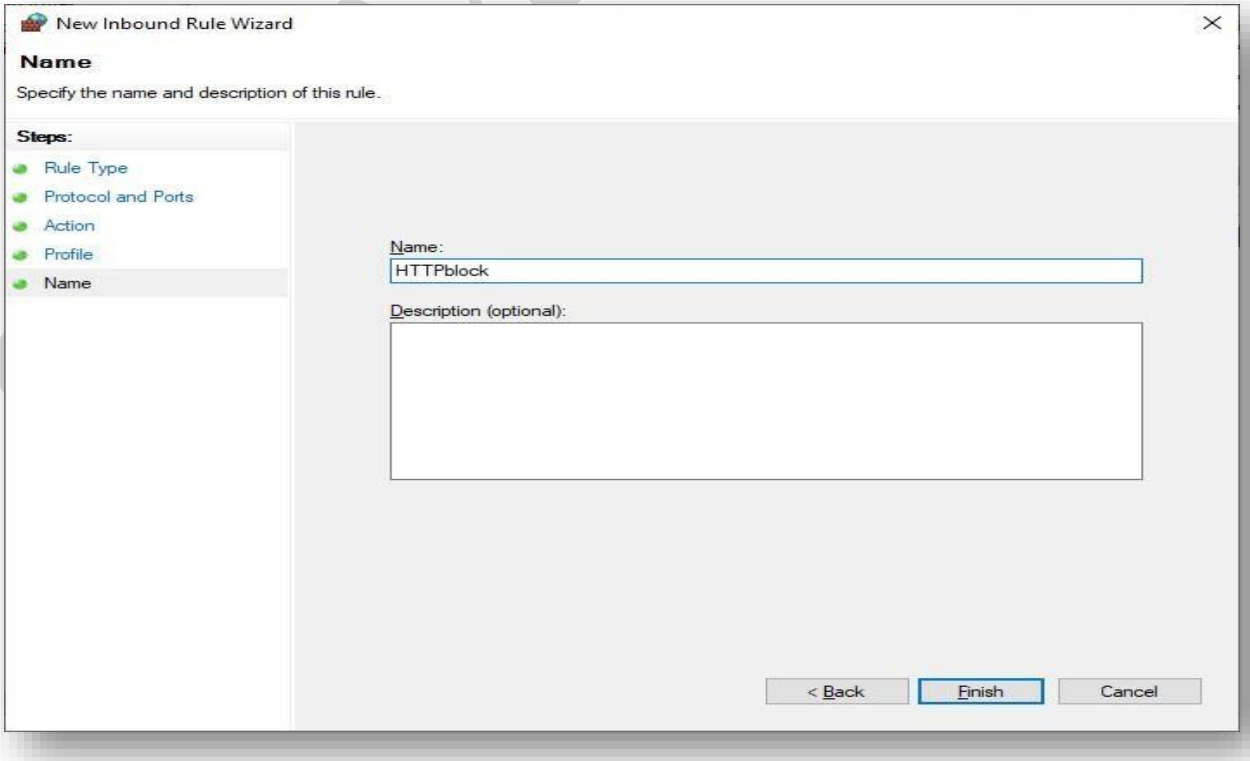

next, we need to finalise the rule

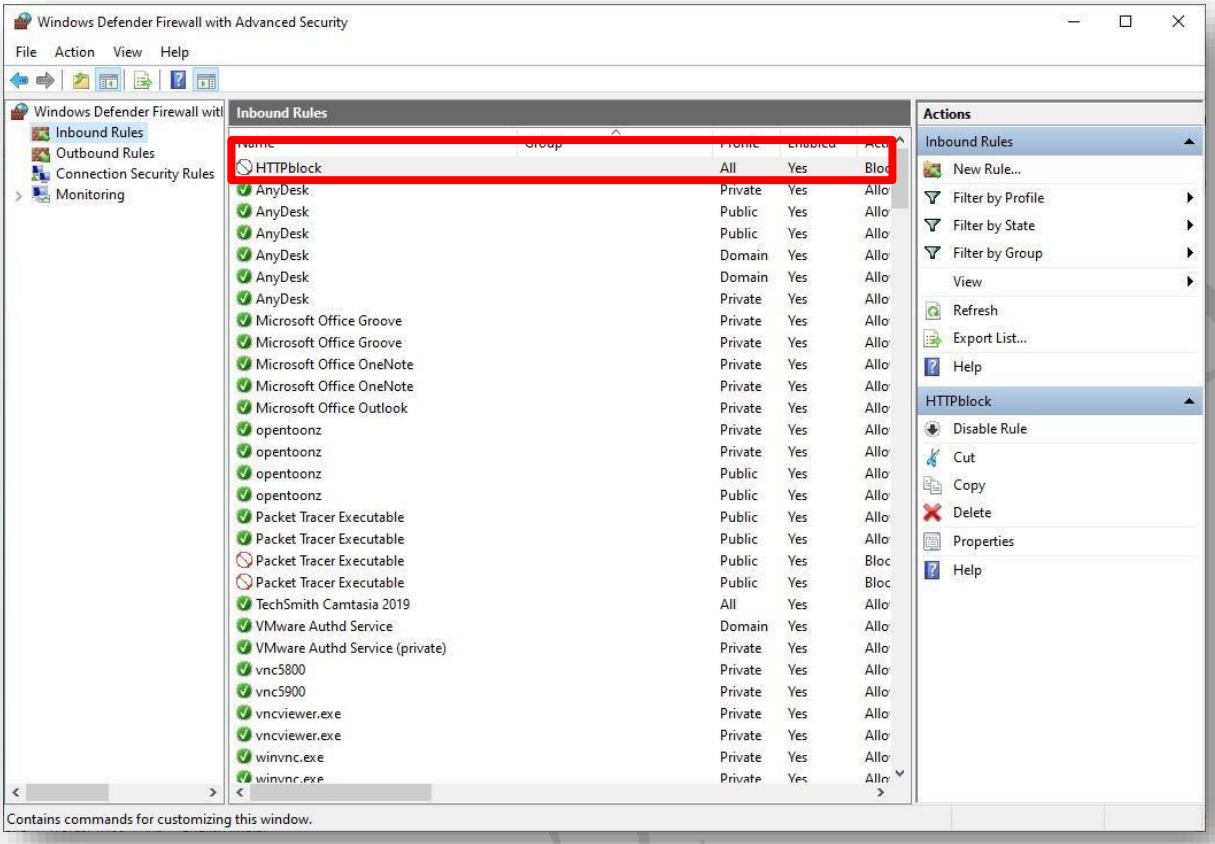

Click ‘Next’ and we get the following

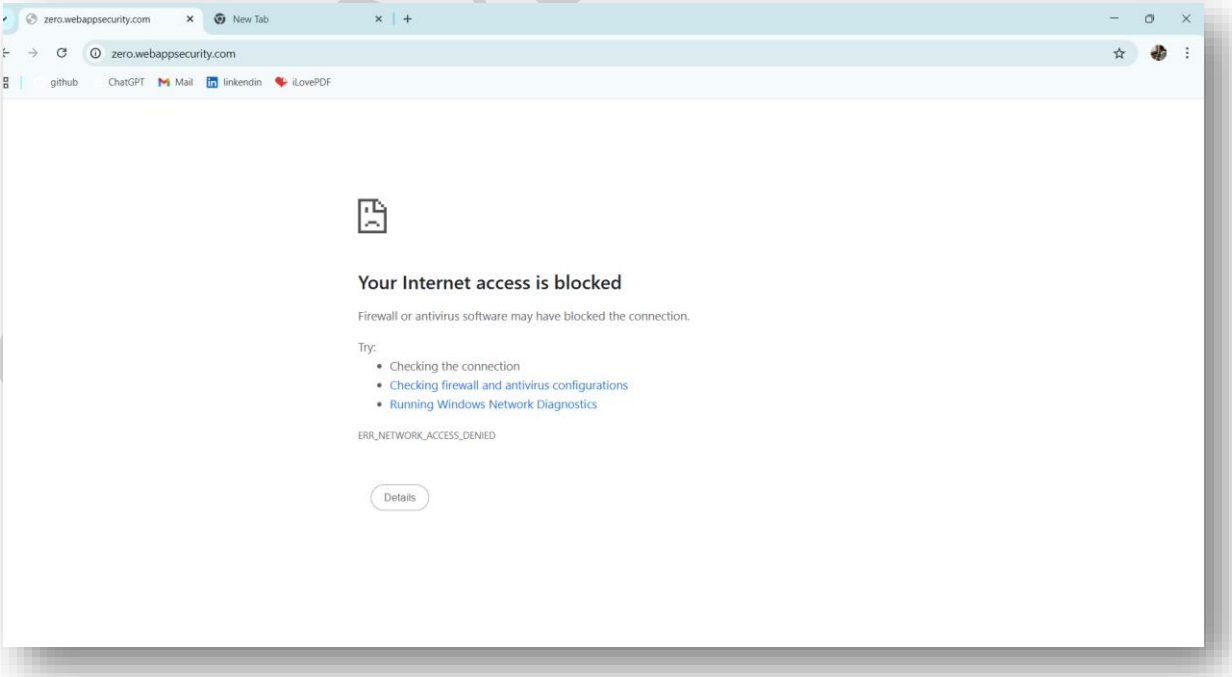

After clicking the ‘Next’ button we need to name the rule and click finish

Inbound rule is added

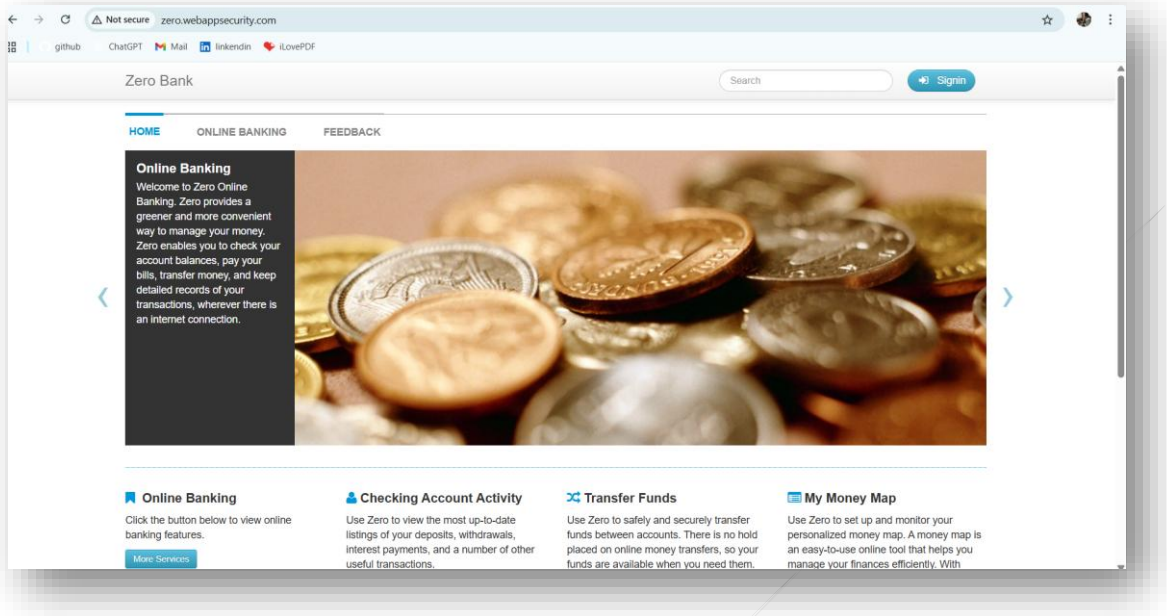

We repeat all the above steps for creating ‘Outbound Rules’, and then try to access the internet. We see that the accessed is blocked

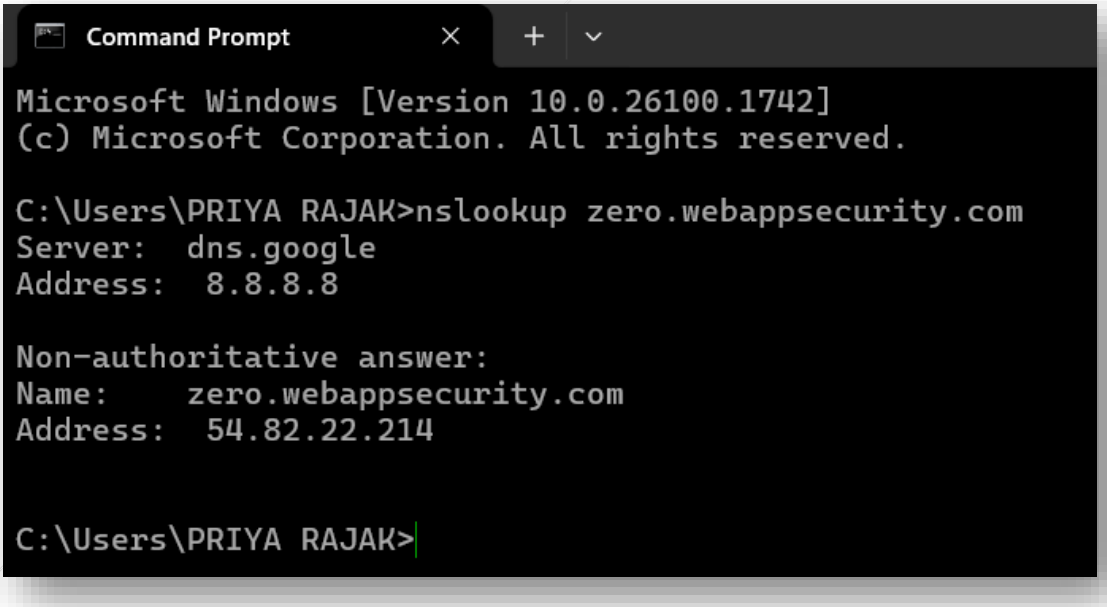

Part 2: Blocking the website zero.webappsecurity.com

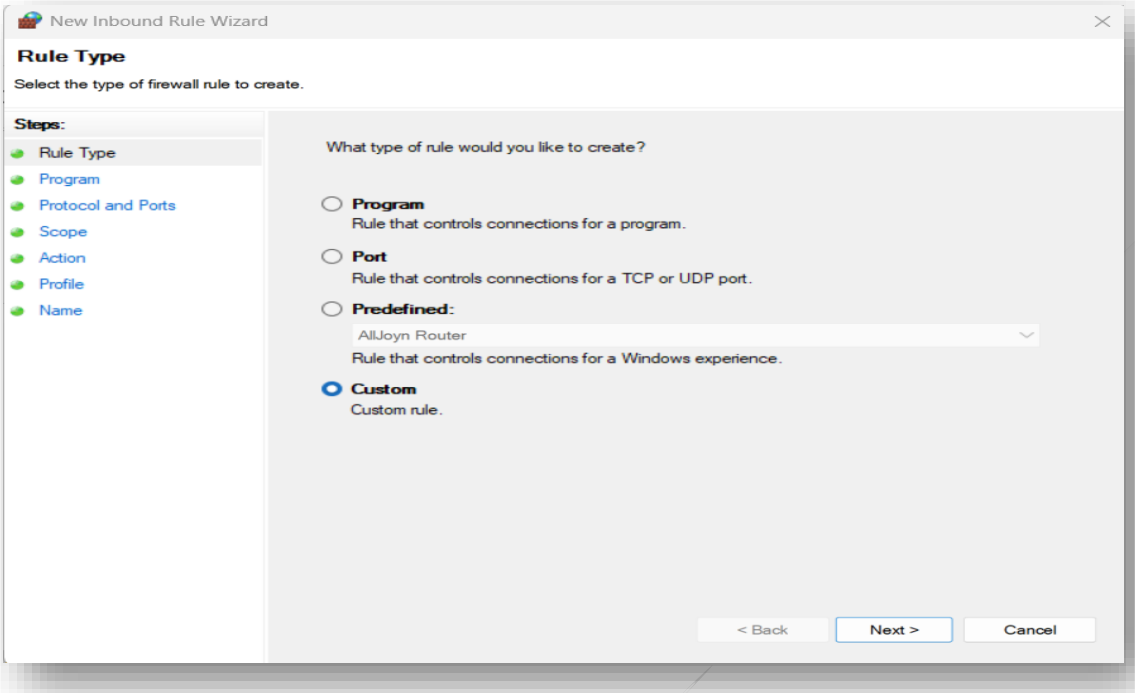

We open the browser and access the website, which is now accessible

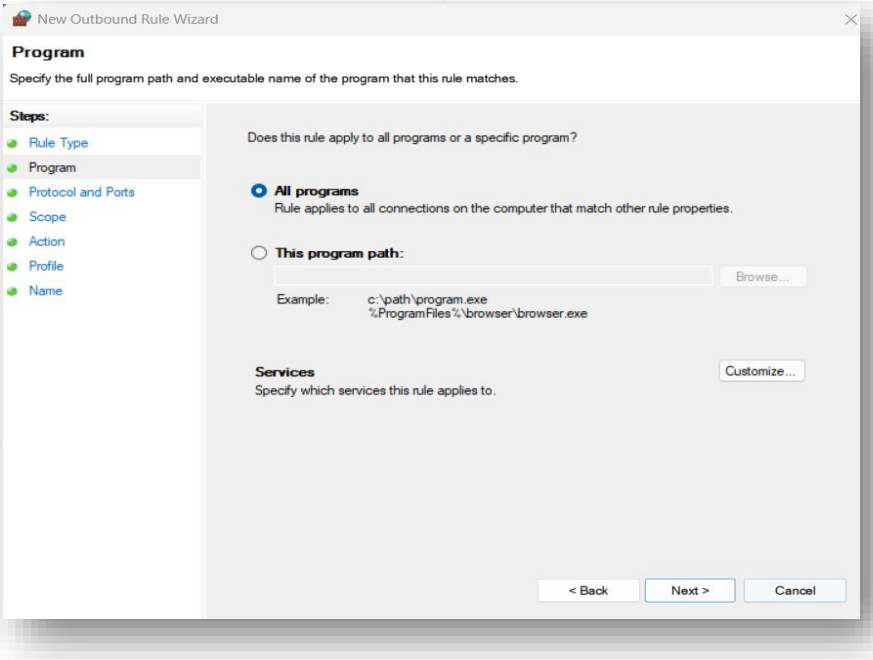

We find the IP addresses of the website using the following command

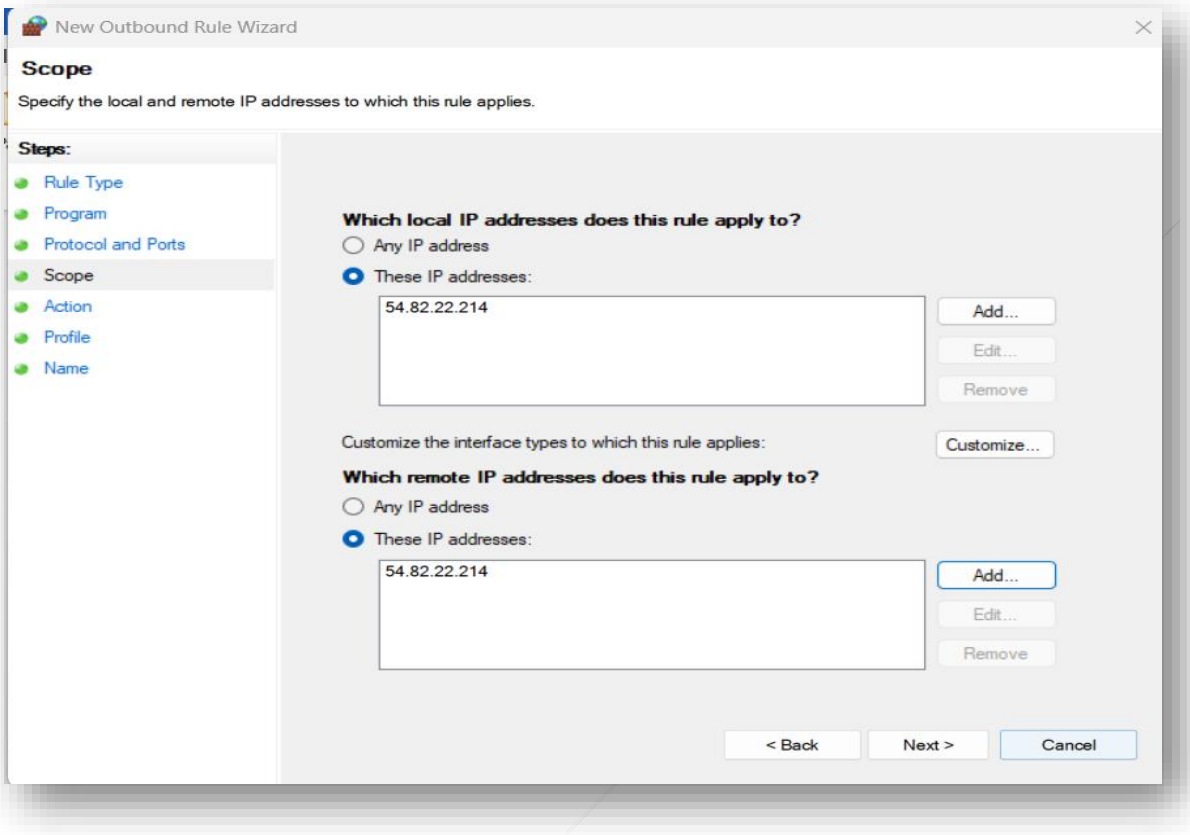

We open the windows Firewall settings and apply the Inbound Rule

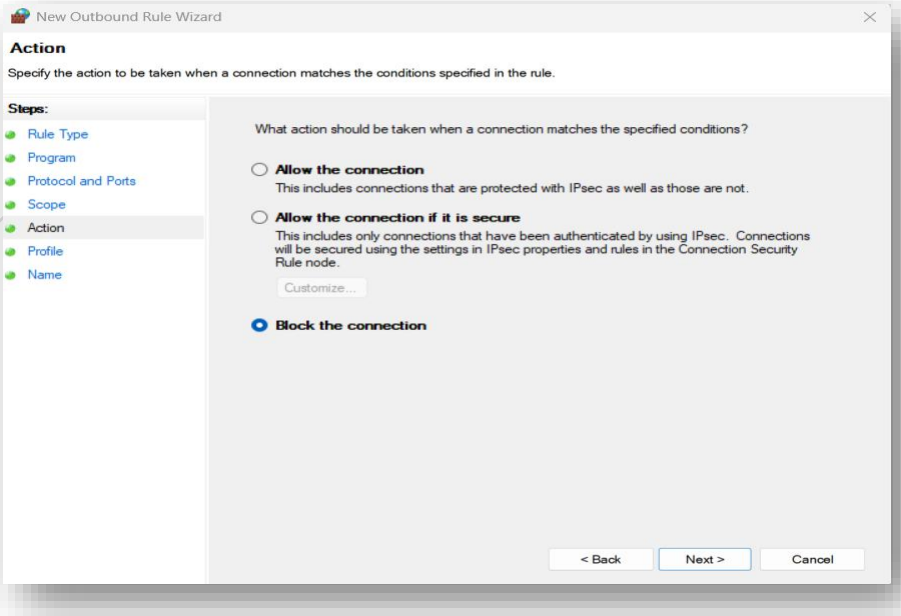

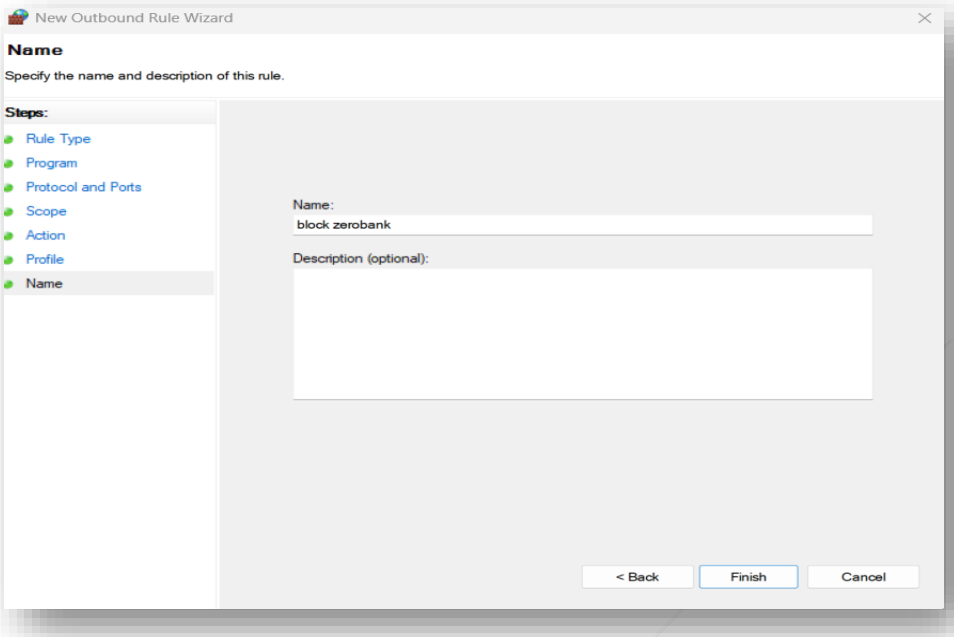

Insert the IP addresses both IPv4 and IPv6

Select Block connection

Provide a suitable name and finish

Repeat the above for Outbound Rules

Now if we try to access the website zero.webappsecurity.com , it would be blocked.
